Contents

1 Introduction 15
1.1 Anatomical planes. Craniometric and anthropometric landmarks 15
1.2 Methods of soft tissue thickness measurement 21
1.3 Anatomical variability 25
1.3.1 Skull variability with aging 26
1.3.2 Differences in male and female skulls 27
1.3.3 Differences in skulls depending on ethnic affiliation 27
1.3.4 The influence of age, gender, and BMI on soft tissue thickness in facial landmarks 28
1.4 Algorithm of non-rigid registration of MRI data to the template and transfer of the landmarks 29
2 Objective and scope of the study 33
3 Experimental data 35
3.1 Public MRI database IXI 35
3.2 Pre-processing of MRI data 37
4 A method for automatic facial soft tissue thickness measurement using MRI data 40
4.1 Overview of the method 40
4.2 MRI head template creation and definition of the reference landmark set 42
4.3 Optimization of parameter set for template creation algorithm 46
4.3.1 Impact of Gaussian smoothing 48
4.3.2 Effect of the sampling rate on the template 49
4.3.3 Effect of intensity inhomogeneity correction 51
4.3.4 Effect of number of averaged images on the template 52
4.3.5 Evaluation of the BMI effect 53
4.4 Validation of the non-rigid registration and the landmarks transfer algorithm 56
4.5 Position correction of craniometric and anthropometric landmarks 59
4.5.1 A correction based on first derivative analysis 65
4.5.2 A correction based on Otsu thresholds 68
4.5.3 A correction based on empirically determined intensity thresholds in landmarks 70
4.5.4 A correction based on results of head tissue segmentation 73
4.5.5 Comparison of the correction algorithms 77

5 Statistical analysis of experimental results of soft tissue thickness measurement 83
5.1 The methodology of statistical analysis 83
5.2 Results 86
6 Discussion 97
7 Summary 103
